3. Literature Survey
4. Scope of the project
5. Methodology
6. Details of designs, working and processes
7. Results and applications
8. Conclusion and future scope
9. References and Bibliography

1. Abstract

The proposed system is an E-commerce web application that helps women entrepreneurs sell homemade food products like papads, pickles, and namkeen online. Many women currently depend on traditional selling methods such as local markets and word-of-mouth, which limit their business growth. This platform provides a centralized online marketplace where multiple sellers can list their products and customers can easily browse and purchase them.

The system has three modules: Buyer, Seller, and Admin. Buyers can register, view products, and place orders. Sellers can add and manage their products, while the Admin controls users, products, and orders. The application will be developed using HTML, CSS, Python (Flask/Django), and SQLite-3 This project supports women empowerment and helps small homemade businesses reach more customers through an easy-to-use web platform.

2. Introduction

1. papads, namkeen, and pickles,upwas,kurdai.
2. It helps organize the process of displaying products and receiving orders through a simple web-based platform.
3. The platform acts as a bridge between women who prepare homemade food and customers who want traditional homemade items.
4. It simplifies the process of viewing products and placing orders, making it convenient for both sellers and customers.
5. The project development phases include topic finalization, requirement gathering, system analysis, design, coding, testing, and final system implementation.
6. The project documentation includes weekly diary, presentation (PPT), project report, and the developed web-based systemThe system provides a platform where women can showcase and sell homemade food products such as.

3.1 Literature Survey

- E-commerce systems have significantly transformed the way products are bought and sold by providing online platforms that connect sellers and customers efficiently. Research shows that digital marketplaces help businesses expand their reach and allow customers to purchase products conveniently. However, many homemade food sellers still rely on traditional selling methods such as local markets and word-of-mouth promotion, which limits their growth and customer base.Studies indicate that digital platforms offer key advantages like product visibility, easy listing, and secure online transactions, which support small vendors in growing their businesses. Specialized or niche e-commerce platforms further improve user experience by helping customers find specific products easily and increasing seller engagement. Research also highlights that participation in digital commerce empowers women entrepreneurs by enabling financial independence and business growth. Despite these benefits, existing platforms such as large multi-seller marketplaces are often complex and difficult for small-scale sellers to use.

3.1 Literature Survey

- To address this, recent studies emphasize the importance of simplicity and usability in system design. Features like easy product uploading, intuitive dashboards, and minimal steps in the buying process improve adoption among users with limited technical knowledge. Clear user interfaces and smooth checkout processes also enhance customer satisfaction and encourage repeat purchases.Furthermore, web-based applications designed for local product promotion demonstrate that integrating features such as product listing, browsing, and purchasing can improve sales performance. Common design practices include role-based access (admin, seller, customer), secure login systems, database-driven product management, and basic order handling modules.

3.2 Problem Defination

1. The system is a web-based application designed to connect home-based food makers with customers who are looking for hygienic, homemade, and affordable meals. In today's fast-paced lifestyle, people often rely on outside food which may not be healthy or safe. At the same time, many skilled home cooks, especially women, do not have a proper platform to showcase and sell their food. This results in limited earning opportunities and lack of access to quality homemade food. The proposed system aims to bridge this gap by providing an easy-to-use platform for ordering, selling, and managing homemade food efficiently while improving communication and trust between customers and sellers.

4.1. Scope of the project

- **Buyer's Role**: Browse and search for homemade food items (papads, pickles, combo pack, namkeen,upwas,kuradi) from different sellers . Add selected products to the cart and proceed to checkout . Complete the payment process (though order tracking will not be implemented at this stage).
- **Seller's Role :-**Register and create a seller profile . List homemade food items with product details such as name, price ,address and ingredients.remove products as needed . View orders (but will not manage the shipping process).
- **Admin's Role** :Admin login into the website at only time where:USERNAME:admin,and PASSWORD:admin@123.and admin only view all seller and buyer of the system and view the number of products available in on our website.
- **Limitations** : No order tracking or delivery management . Only web-based application, no mobile application in the first version . The system will not handle the shipping logistics, and the seller will be responsible for handling that.

4.2 System Requirement

- **Hardware Specification:**

  Windows 10 / 11 (64 bit)

  Intel(R) Core(TM) i3 or above

  4 GB RAM (minimum)

  10 GB free disk space

- **Software Specification:**

  Server: Flask (Python Web Framework)

  Database: SQLite

  IDE/Editor: VS Code / PyCharm

  Browser: Google Chrome

- **Technology used to develop project:**

  Structure: HTML

  Design: CSS

  Backend: Python (Flask)

  Database: SQLite-3

4.3 User Of System

1. **Admin**

Role - Manage entire website system

- Add / Remove users (Customers & Sellers)
- Approve homemade food sellers
- Manage product categories
- Monitor orders
- Track overall system performance

2. **Seller (Home Chef / Women Entrepreneur)**

Role - Register and create profile

- Add homemade food products
- Update product details (price, description, image)
- Manage incoming orders

User Of System

- Accept / Reject orders

- Update order status

3**. Customer (User)**

Role - Register and login

- Browse homemade food products

- Search food items

- Add items to cart

- Place orders

4. Methodology

- **Overall Working of the System:**
  - Buyer Workflow : Browse available products listed by various sellers . Add items to the shopping cart . Proceed to checkout and complete the purchase . No need for order tracking as the platform will only handle the product purchase process.
  - Seller Workflow : Register and log into the platform . Add products, including necessary details like images, description, price, and availability . View orders placed by customers.
  - Admin Workflow : Log in to the system to access all user data (sellers and customers).Review product listings for authenticity and correctness . Manage user profiles (sellers and customers).Monitor the system for issues, ensuring smooth transactions
  - **Flow of Operations:** Buyer: Login → Browse Products → Select Items → Add to Cart→ Checkout → Add/Update Products → View Orders

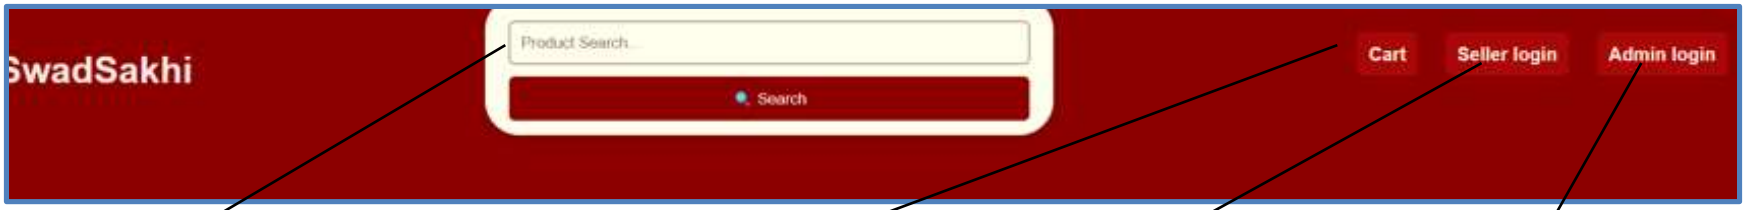
    Admin: Login → Manage Sellers → View Products → View Orders → Manage Customers System

    Seller Login →sSelect Item To Add → Add products → Delete Products → Add In gredientes
  - **Architecture (Block Diagram and Explanation):**The system architecture can be divided into three modules: Buyer, Seller, and Admin.
  - Buyer Module: Allows users to browse products, add to cart, and complete orders.
  - Seller Module: Allows sellers to manage their product listings, view orders, and maintain their profiles.
  - Admin Module: Provides complete control over the system, allowing the admin to manage users, products, and orders . Diagram may be hand-drawn at the outline stage.

6. Details of designs,working and processes

The homepage provides a user-friendly interface showcasing products added by sellers. It includes a search bar for easy product discovery, a cart for managing selected items, and dedicated buttons for Seller Login and Admin Login. The design ensures smooth navigation and efficient browsing for users.

6. Details of designs,working and processes



"The search bar allows users to easily search and find products by entering keywords, making browsing faster and more convenient."

"The cart allows users to view and manage selected products before purchase. Users can update quantities, remove items, and check the total price. It provides a simple and efficient way to review orders before proceeding to checkout."

"The seller can add new products, set product quantity, and delete products. It helps sellers easily manage their product listings."

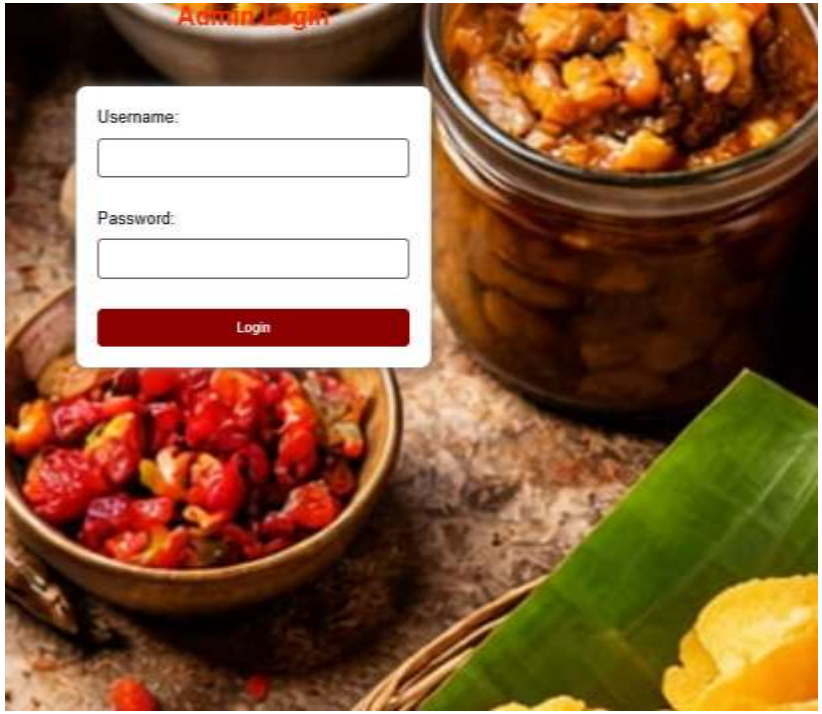
"The admin can view the total number of users, sellers, and admins. It helps in monitoring and managing the system."

6. Details of designs,working and processes

Cart:-This is the login and Register of Add products to cart and then Also buy from the cart.In cart the user add his/her products.and buy from the cart by using the given login & if the is not already register then firstly register and then login into the system.

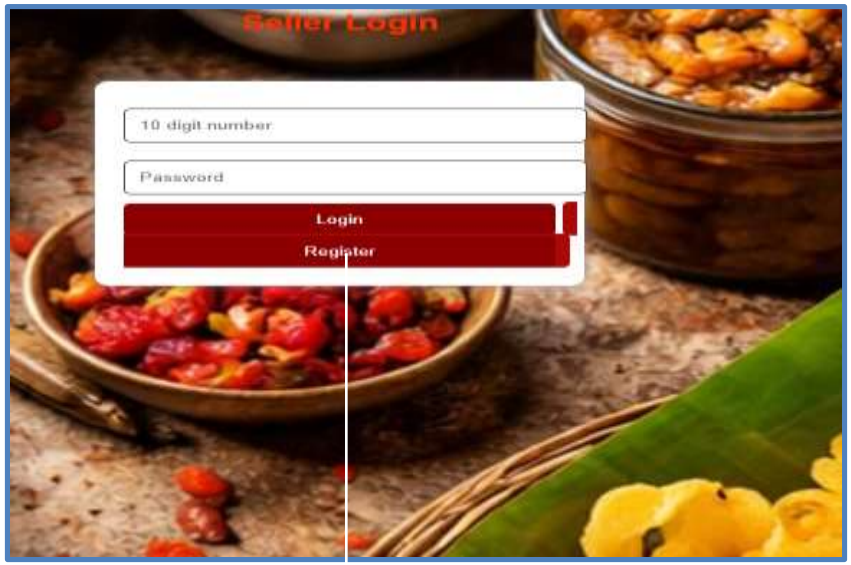
Your Cart:-Product name,Price,Unit,Subtotal,select the Pack Quantity and Delete the product Button from Cart if user wants ,The total of products saw Below,and Button of “Place Order”.

5. Details of designs, working & processes

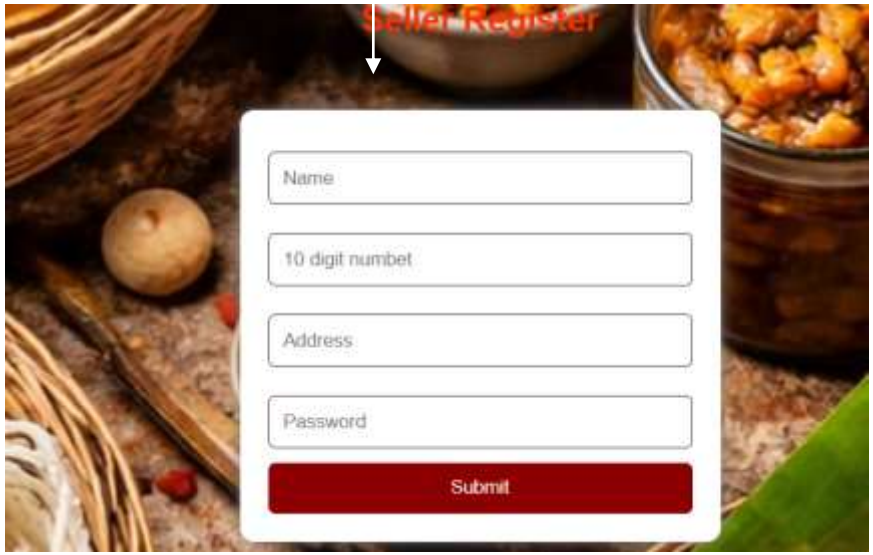


This is the Admin Login Form and Admin Dashboard where the Username:-Admin and Password:-Admin123 which is fixed the system .
When the Admin login into the system he/she only view the No. of products, No. of seller, No. of Buyers in our system.

5. Details of designs, working & processes

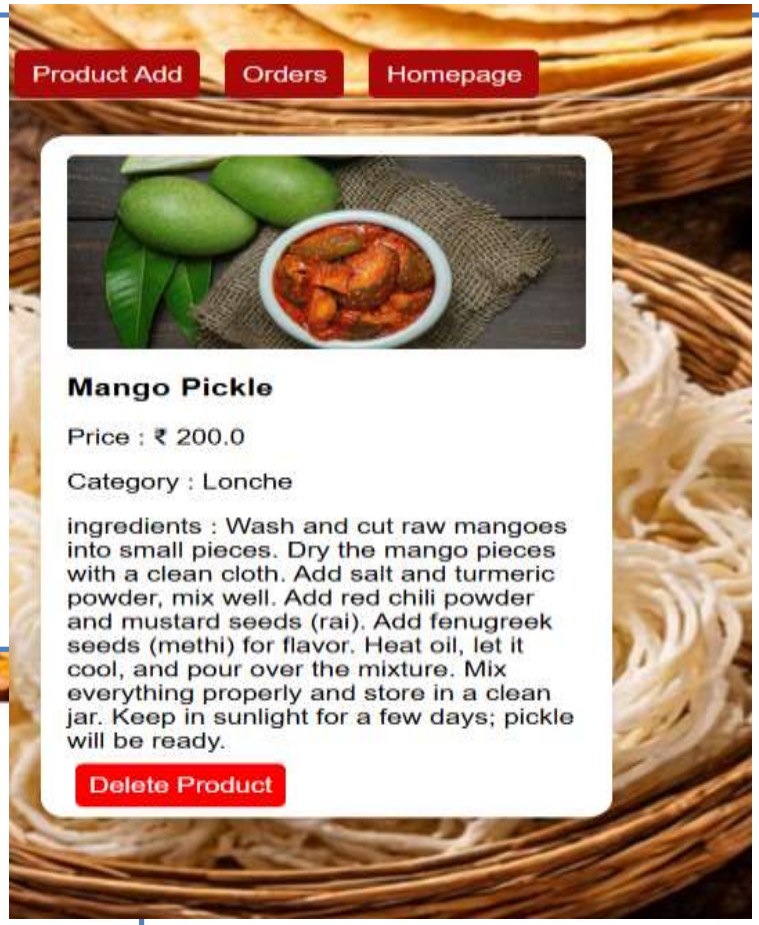


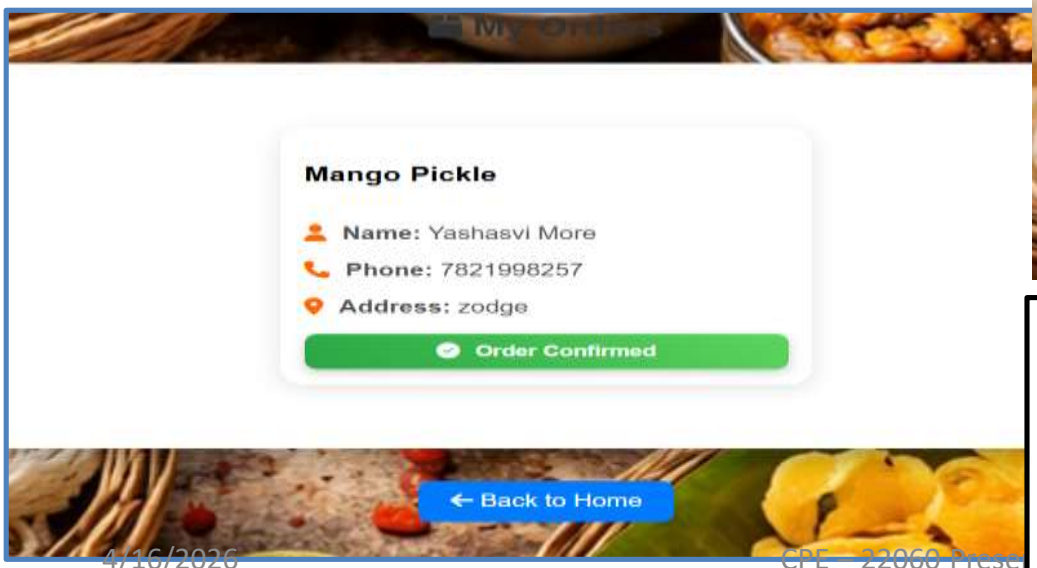
Seller Login :- The Seller login into the system by using this login form where we give 10digit no,Name,Address,Password as PerSeller choice and then register into the system if already register then the seller only login at everytime when wants to add products.



When the Seller not Register into the system then the system Give message to “Not such user found please Register”
Then Register the details as follow Name,10 Digit,Address,Password and then click on Submit Button.Then Redirect to the next page to add products.

5. Details of designs, working & processes





The products add In the first screenshot and then seller add the products into the system and also delete the product and the places by using ADD button into the Cart.

7.2 Application

1. Swadsakhi system helps to connect homemade food sellers (especially women entrepreneurs) with customers through an online platform. It allows easy buying and selling of homemade food products.

2. This system benefits both sellers (to grow their business) and customers (to get fresh homemade food easily).

8.1 Conclusion

The proposed project, Home-made Food Products E-commerce Platform, aims to provide a digital solution for selling homemade papads, pickles, and namkeen through a single online platform. This system bridges the gap between women entrepreneurs and customers by offering an easy-to-use interface for buying and selling authentic homemade food items . The project not only supports local and home-based businesses but also enhances customer convenience by providing multiple product choices in one place. Overall, this system promotes digital entrepreneurship, self-employment, and efficient business management.

8.2 future scope

1. Add order status updates (Order Placed → Packed → Shipped → Delivered).SMS or email notifications for order updates.
2. Online Payment Integration:-The present system may use simple payment methods. Future improvements can include:
3. Integration with UPI, Debit/Credit Cards, Net Banking
   - Mobile Application Development
   - Multi-Language Support.
   - Voice-based navigation for less educated users.
   - Expansion to Other Homemade Products
4. Rating and Review System Customers can:
   - Rate products . Write reviews.
   - Provide feedback for sellers.
