Chapter 1
Introduction and Background of Industry

1.1 Introduction

the SwadSakhi Web-Based Homemade Food Platform, which connects home-based food sellers with customers through a simple and user-friendly interface. It explains how products are listed, browsed, and ordered within the system. The platform focuses on providing an easy and efficient way for users to access homemade food online.

The main objective of this system is to support small-scale home-based businesses and help customers find fresh, hygienic, and traditional food items easily. Sellers can upload product details such as name, price, and category, while buyers can browse and place orders as per their needs. The system makes the process faster, simpler, and more convenient.

1.2 Background of Industry

The food industry is one of the most important and rapidly growing sectors in today's world, especially in India where traditional and homemade food has a special cultural significance. In recent years, there has been a noticeable shift in consumer preferences from processed and packaged food towards fresh, homemade, and hygienic food products. People are becoming more health-conscious and prefer food that is prepared using traditional methods without harmful preservatives.

At the same time, the growth of the internet and digital technologies has significantly influenced the way businesses operate. The emergence of e-commerce platforms has made buying and selling products easier, faster, and more accessible. These platforms have created new opportunities for small-scale businesses and home-based entrepreneurs to reach a wider audience without the need for physical shops or large investments.

Despite these advancements, many home-based food sellers still face several challenges such as limited market reach, lack of proper marketing platforms, and difficulty in managing customers and orders. Most of these sellers depend on local customers or word-of-mouth promotion, which restricts their business growth. On the other hand, customers also find it difficult to locate reliable sources for authentic homemade food products online.

To overcome these challenges, the SwadSakhi system is developed as a web-based e-commerce solution that connects sellers and buyers on a single platform. It allows sellers to register, upload product details such as name, price, category, ingredients, and images, and manage their products efficiently. Buyers can browse various categories, view product details, add items to the cart, and place orders easily.

The system not only promotes homemade food products but also supports small entrepreneurs by providing them with a digital platform to expand their business. It helps in preserving traditional food culture while integrating modern technology. Overall, the SwadSakhi system plays an important role in enhancing the growth of the homemade food industry and improving accessibility for customers.

Chapter 2
Literature Survey and Specification

2.1 Study of Existing System / Review of Research Papers

Various research studies have been conducted on online food delivery systems and digital food platforms. These studies highlight the rapid growth, advantages, and limitations of existing systems.According to several research papers, online food delivery systems are primarily designed to connect restaurants with customers through websites or mobile applications. These systems allow users to browse menus, place orders, and make payments easily, improving convenience and reducing waiting time.A systematic review of online food delivery literature shows that the industry has evolved from simple websitebased ordering systems to advanced mobile applications and online-to-offline (O2O) platforms. Modern systems also include features like real-time tracking, digital payments, and customer feedback.

Research also identifies key areas such as consumer behavior, digital interaction, operational management, and trust issues in food delivery platforms. Customer satisfaction, ease of use, and service quality are major factors influencing the success of these systems.Furthermore, studies highlight that online food delivery platforms have significantly impacted the food business by increasing customer reach and improving operational efficiency. However, they also bring challenges such as high competition, dependency on technology, and issues related to service quality and trust.Despite these advancements, most existing systems mainly focus on restaurants and large food businesses. There is limited support for smallscale or home-based food providers. These platforms often lack features specifically designed for homemade food sellers, such as personalized product listings, small-order management, and direct customer interaction.Hence, there is a need for a system like SwadSakhi, which focuses on empowering home-based food entrepreneurs by providing a dedicated platform tailored to their requirements.

2.2 Limitations of Existing System / Problems Discussed in Research Papers

Existing e-commerce systems and online food platforms have significantly improved convenience for users; however, they still have several limitations, especially in supporting small-scale and home-based food businesses. One of the

major limitations is that most popular platforms mainly focus on large-scale sellers and branded products, making it difficult for small homemade food producers to compete and gain proper visibility.

Another major issue is the high commission charges and fees imposed by these platforms. Small sellers often find it difficult to afford these costs, which directly reduces their profit margins. In addition, the registration and product listing processes in many existing systems are complex and time-consuming, requiring technical knowledge that many home-based sellers may not possess.

Research studies also highlight the lack of personalization and dedicated support for homemade food products. Most existing platforms are designed for general product selling or restaurant-based food delivery services, rather than focusing on traditional and homemade food items. As a result, the promotion of local food culture is limited, and authentic homemade products do not reach a wider audience.

Another important limitation is the difficulty in building trust between buyers and sellers. Since homemade food sellers are not wellknown brands, customers often hesitate to purchase due to the absence of proper reviews, ratings, or verification systems. This reduces buyer confidence and affects the growth of small sellers.

Furthermore, many existing platforms do not provide simple and effective tools for managing orders, inventory, and customer interactions for small sellers. This creates operational challenges and reduces efficiency.

Buyers also face difficulties in finding genuine homemade food products due to the lack of proper filtering and categorization.

The SwadSakhi system is developed to overcome these limitations by providing a simple, user-friendly, and dedicated platform specifically for homemade food products. It reduces complexity, improves accessibility, and helps small sellers expand their business by connecting them directly with customers.

2.3 Problem Definition

In the current digital market, most online food delivery platforms are designed to serve restaurants and large-scale food businesses, while home-based food providers remain largely unsupported. Many individuals, especially women, prepare high-quality homemade food but lack a proper platform to promote and sell their products.

Due to limited reach, lack of marketing toolsand absence of digital presence, these small-scale entrepreneurs

these small-cale entrepreneurs struggle to connect with potential customers. Additionally, existing systems do not effectively support customized orders, direct communication, and small-scale operations, which are essential features for homemade food services. As a result, both sellers and customers face difficulties—sellers are unable to grow their business, and customers have limited access to fresh, hygienic, and homemade food options.

Therefore, there is a need to develop a dedicated system like SwadSakhi that provides a userfriendly platform for home-based food providers to showcase their products, manage orders efficiently and connect with a wider audience.

2.4 Specification

The proposed system SwadSakhi is a web-based online platform designed to support the promotion and sale of homemade food prepared by home-based cooks and small-scale food entrepreneurs. The system enables sellers to register, list, and manage their food products online, while customers can easily explore a variety of homemade dishes such as snacks, meals, sweets, and traditional food items.

The platform also provides features for browsing, searching, and ordering food, along with options for customized or bulk orders as per customer requirements. It ensures smooth interaction between customers and sellers, helping in better communication and order management.

The system aims to provide a simple, user-friendly interface that helps home-based food providers promote their products and connect with a wider customer base. By using digital technology, SwadSakhi supports small entrepreneurs, encourages selfemployment, and promotes the availability of fresh, hygienic, and homemThe proposed system SwadSakhi is a web-based online platform designed to support the promotion and sale of homemade food prepared by home-based cooks and small-scale food entrepreneurs. By using digital technology, SwadSakhi supports small entrepreneurs, encourages selfemployment, and promotes the availability of fresh, hygienic, and homemade food.

Questionnaire Ask To Seller

Quetions	**Answer**
1. Do you currently sell homemade food	Do you currently sell homemade food pr
2. What type of food items do you prepare?	1mainly prepare snacks, traditional items, papad, and homemade meals.
3.Do You face difficuly in reaching cust	, it is difficult to reach more customer v online platform
4.Would you like to say your food online through a platform	Yes, my it will help me increase my cust and sellers
5.It is easy for you to manage order manual	No,managing orders manually is so confusing and timeconsuming.
6.Do you prefer a system where you can u manage your food iteams	Yes, it will make my work easier organized
7. How do you correctly communic customers	I usually communicate through phone messages
8.Would you find it usefull to resive orc (name,phone,address) in one place	Yes ,I will help in better order manage delivery
9.Do you face issues in handling multiple orders in same times	Yes,sometimes it becomes difficult to multiple orders

Chapter 3
Scope of Project

The scope of SwadSakhi is to develop a web-based platform that connects homebased food providers with customers in a simple and efficient manner. The system focuses on promoting homemade food by providing a dedicated marketplace where sellers can showcase their home made products and manage orders easily.

The project includes features such as user registration, product listing, browsing food items, placing orders, and managing customer interactions. It allows home-based cooks to expand their reach beyond local areas and build a wider customer base through an online platform.

Additionally, the system supports customized and small-scale orders, which are commonly required in homemade food services. It also aims to improve communication between customers and sellers, ensuring better service and satisfaction.

Chapter 4
Methodology

The development of SwadSakhi follows a structured methodology to ensure systematic design, development, and successful implementation of the system.

1. Requirements Identification

In this phase, the requirements of the system are identified by analyzing the needs of home-based food sellers and Buyers. Many sellers face difficulty in reaching Buyer and managing orders, while Buyers require a simple platform to find homemade food.

Key requirements identified include user registration, product listing, order placement, order management, and communication between sellers and Buyers. The system also needs to be simple, easy to use, and accessible to users with basic technical knowledge.

2. System Planning and Design

After identifying the requirements, the system architecture and design are planned. This phase includes designing the database structure, user interface, and overall workflow of the system.

The database is designed to store information such as user details, food items, and order records. The user interface is designed to be simple and attractive so that both sellers and customers can easily interact with the system. The workflow is structured to ensure smooth navigation from browsing products to placing and managing orders.

Proper planning ensures that the system functions efficiently and provides a better user experience.

3. System Development

In this phase, the actual development of the system is carried out using appropriate technologies. The frontend of the system is developed using HTML, CSS, and JavaScript to create an interactive user interface.

The backend is developed using Python (Flask framework), which handles the application logic and processes user requests. The database is used to store and manage data such as user information, product details, and orders.

Features such as user registration, product upload, order placement, and order editing are implemented. Sellers can manage their products and orders, while customers can browse items and place orders easily.

4. Testing and Evaluation

After development, the system is tested to identify and fix errors or bugs.

Different types of testing are performed to ensure the system works correctly. Functional testing is done to check whether all features, such as registration, product listing, and order placement, are working properly. Usability testing is performed to ensure the system is easy to use and user-friendly.

The system is evaluated based on performance, accuracy, and user satisfaction to ensure it meets the required objectives.

5. Implementation

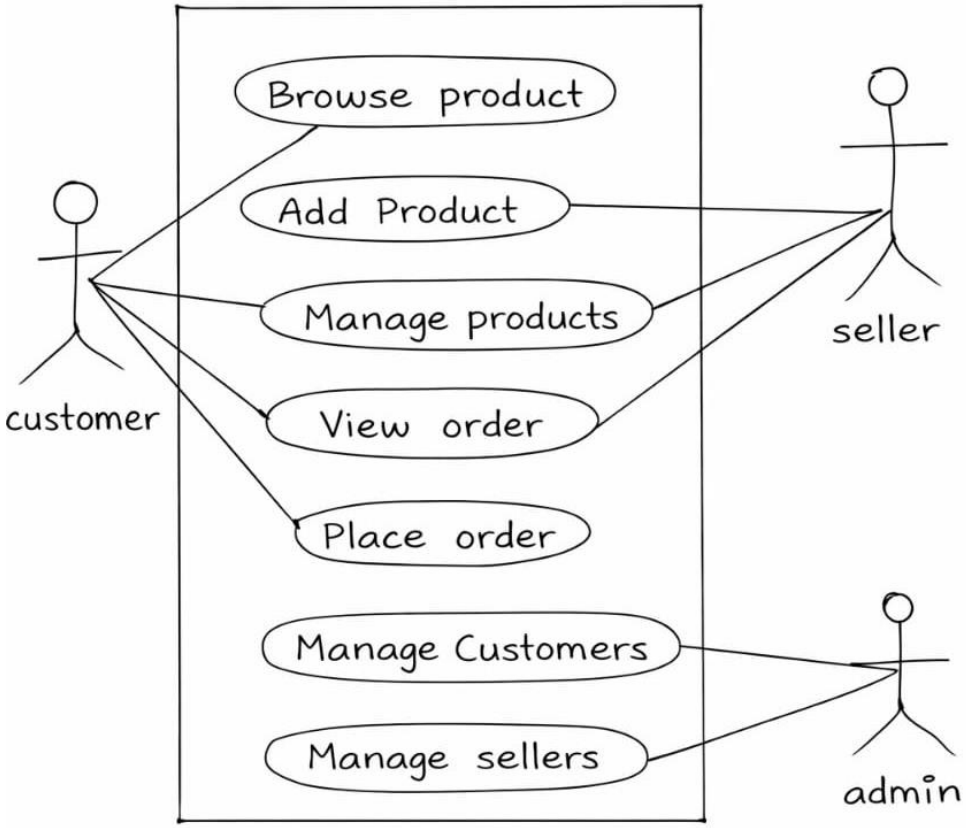
In the final phase, the system is deployed and made available for users. Sellers can register and start uploading their food items, while customers can browse products .

The delivery process is managed manually by the sellers through direct communication with customers using contact details provided in the order.

The system displays order status as “Order Confirmed” to keep users informed.

Proper guidance and support are provided to users to ensure smooth usage of the system. The implementation of SwadSakhi helps promote homemade food businesses and provides a simple and effective platform for both sellers and customers.

4.1 UseCase Diagram



UseCase Diagram Description:-

The UseCase Diagram of SwadSakhi represents the overall working and structure of the system. At the center, the SwadSakhi Core Processing System acts as the main unit that manages all operations and communication between different modules.

On the left side, the input modules are shown. The Home Cook Registration module allows sellers to register and create their profiles. The Food Product Data module includes details such as dish name, category, images, price, and description. The Customer Requirements module captures user details like name, contact, address, and preferences. The Custom/Bulk Order Request module allows customers to place special or large quantity orders and the Order Status Input module updates order confirmation and delivery status.

On the right side, the output and management modules are displayed. The Customer Marketplace View enables users to browse food items, compare dishes, and

place orders. The Seller Dashboard allows home cooks to manage their food listings, update items, and view ratings and feedback.

The Admin Control Panel is responsible for verifying sellers and maintaining the system.

At the bottom, the System Database stores all important data such as seller information, food items, customer details, and order records. The core system continuously interacts with the database to store and retrieve information.Overall, the diagram shows how different components of SwadSakhi work together to provide a smooth and efficient platform for homemade food selling and ordering

4.2 Action Plan

The action plan of SwadSakhi outlines the step-by-step process followed to successfully complete the project within the given time frame.

This action plan ensures that the project is developed in an organized and efficient manner.

1. Problem Identification

1. Studied existing food delivery systems and their limitations
2. Identified lack of support for home-based food sellers
3. Observed issues like low visibility, high commission, and complex processes
4. Finalized the idea of creating a dedicated platform for homemade food

2. Requirement Gathering

1. Collected requirements for both sellers .
2. Identified key features such as:
3. Product upload and management
4. Order placement and editing
5. Customer-seller communication

Ensured the system should be simple and user-friendly

3. System Design

1. Designed the overall system architecture
2. Created database structure for storing:
3. User details
4. Product information
5. Order records

Planned user interface layout for better user experience

Defined workflow from product browsing to order confirmation

4. System Development

1.Developed frontend using HTML, CSS, and JavaScript 2.Developed backend using Python

(Flask)

3. Implemented features such as:

4. Seller registration and login
5. Product listing
6. Order placement and update

Integrated database for storing and retrieving data

5. Testing and Debugging

1. Performed functional testing of all modules
2. Checked features like registration, product upload, and order system
3. Conducted usability testing for user-friendliness
4. Fixed bugs and improved system performance

6. Implementation

1. Deployed the system for actual use
2. Allowed sellers to register and upload products
3. Enabled customers to browse and place orders
4. Ensured smooth working of all system features

7. Delivery Process Handling

1. Orders are received and confirmed by sellers
2. Seller contacts customer using provided details
3. Delivery is managed manually by the seller
4. Order status is shown as “Order Confirmed” in the system

8. Final Outcome

1. Provided a platform for homemade food sellers
2. Improved visibility and business opportunities

Chapter 5

5.1 Details of designs, working and processes

The diagram represents the working process of the SwadSakhi system, which connects buyers and sellers through an online platform with admin control.

1. Buyer (Customer)

The process starts with the buyer. The buyer first registers or logs into the system. After logging in, the buyer can browse available products. The buyer then adds selected products to the cart and proceeds to place an order.

2. Add to Cart

Once the buyer selects products, they are added to the cart. After reviewing the cart, the buyer confirms and places the order.

3. Seller

On the seller side, the seller registers or logs in to the system. The seller can add new products, update or delete existing products, and manage incoming orders. After receiving an order, the seller processes it.

4. System Process

The system acts as a bridge between buyer and seller. It stores product data and order details, connects buyers with sellers, and processes the order efficiently.

5. Admin

The admin monitors the entire system. The admin can view all products, check total buyers and sellers, and monitor all orders to ensure smooth functioning.

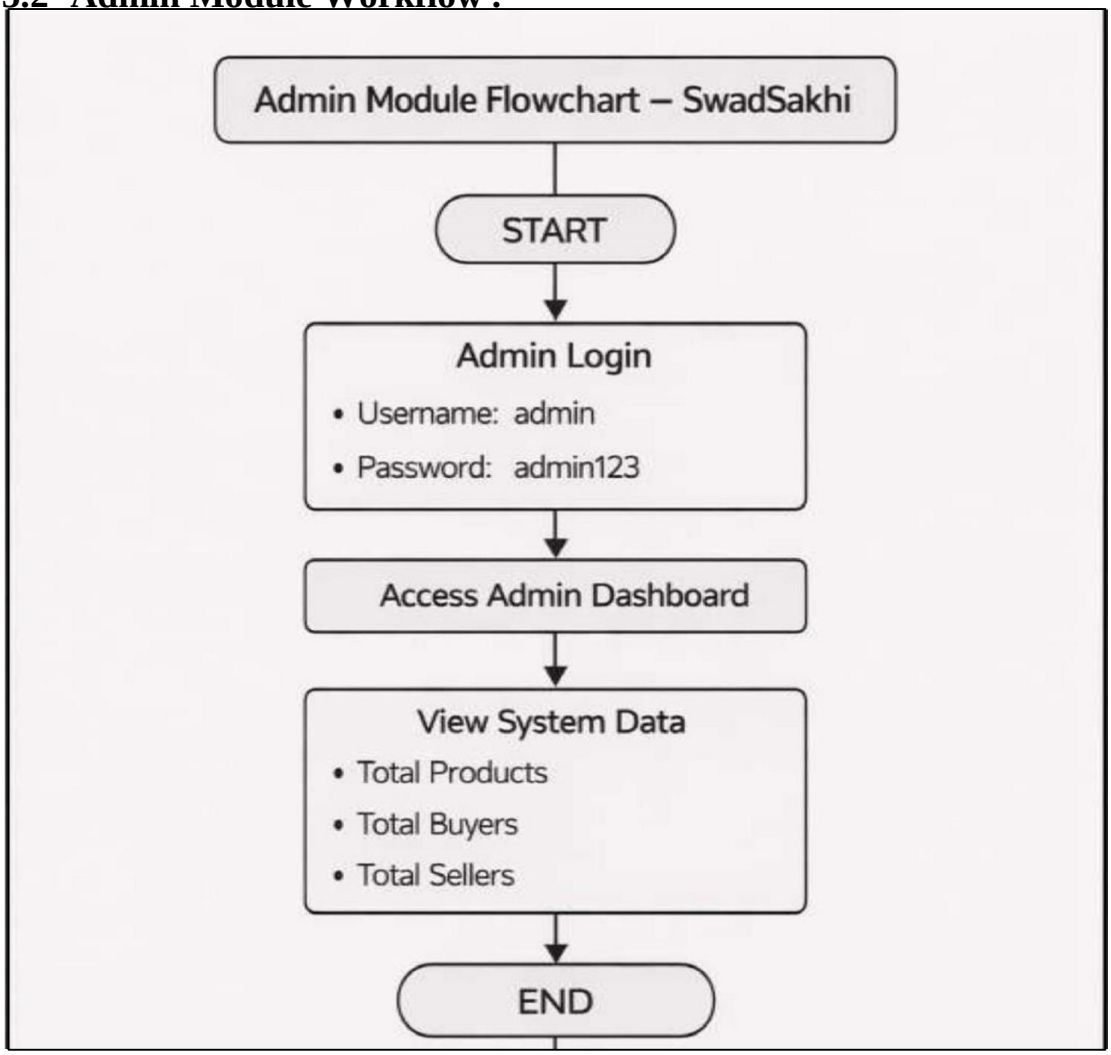
6. Database

All important data such as user details, product information, and order records are stored in the database.

7. Final Output

Finally, the order is successfully , and all related data is securely stored in the database.

5.2 Admin Module Workflow :-



1.Start

The process begins when the admin starts the system.

2.Admin Login

The admin enters login credentials to access the system.
The valid credentials are:
Username: admin
Password: admin123
If the details are correct, the admin gets access to the dashboard.

3.Access Admin Dashboard

After successful login, the admin is directed to the admin dashboard.

4.View System Data

The admin can view important system information such as:
Total number of products Total number of buyers Total number of sellers

5.End

After checking the details, the process ends and the admin can logout from the system.

5.3 Seller Module Workflow :-

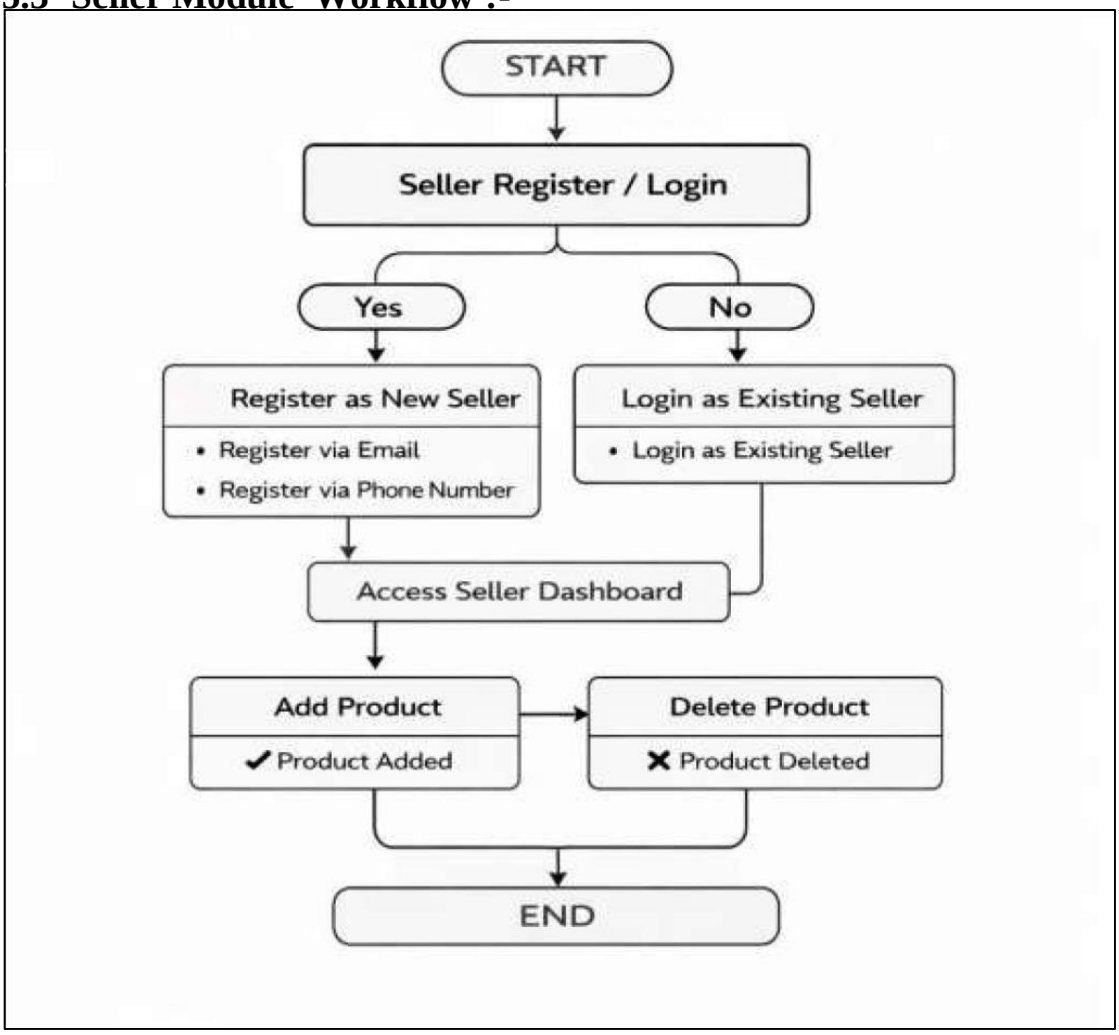


Fig5.3 Seller Module Workflow

1. **Start**

The process begins when the seller opens the system.

2. **Seller Registration / Login**

If the seller is new, they need to register by providing required details.
If the seller already has an account, they can directly login.

3. **Access Seller Dashboard**

After successful login or registration, the seller is redirected to the seller dashboard.

4.Add Product

The seller selects the option to add a product.

They fill product details such as name, price, description, and image, and then submit it.

5. **Product Management**

After adding the product: The seller can view added products

The seller can delete products if needed

6. Display on Home Page

The products added by the seller are displayed on the homepage for buyers to view and purchase.

7. End

The process ends after successful product addition and management.

5.4 Buyer Workflow :-

1. Start

The process begins when the buyer opens the SwadSakhi application or website. This is the initial step where the user enters the platform to explore available products.

2. Login / Register

The buyer logs in using existing credentials such as username and password. If the user is new, they can register by providing required details like name, email, and contact information.

3.Browse Products

After successful login, the buyer can browse various products listed on the platform. Products are displayed category-wise, making it easy to explore different items like pickles, snacks, and homemade food items.

4.Search / Filter

The buyer can search for specific products using keywords or apply filters such as price range, category, or ratings to quickly find suitable items.

5.Select Product

From the displayed list, the buyer selects a product of interest by clicking on it. This step helps the user move forward to view more detailed information.

6. View Details

The buyer views complete information about the selected product, including price, ingredients, description, image, and seller details. This helps in making an informed decision**.**

7.Order Product

If the buyer decides to purchase immediately, they can directly place an order for the selected product. This step confirms the buyer's intent to buy the product.

8.Add to Cart

Alternatively, the buyer can add the product to the cart for future purchase.
Multiple products can be added before final checkout.

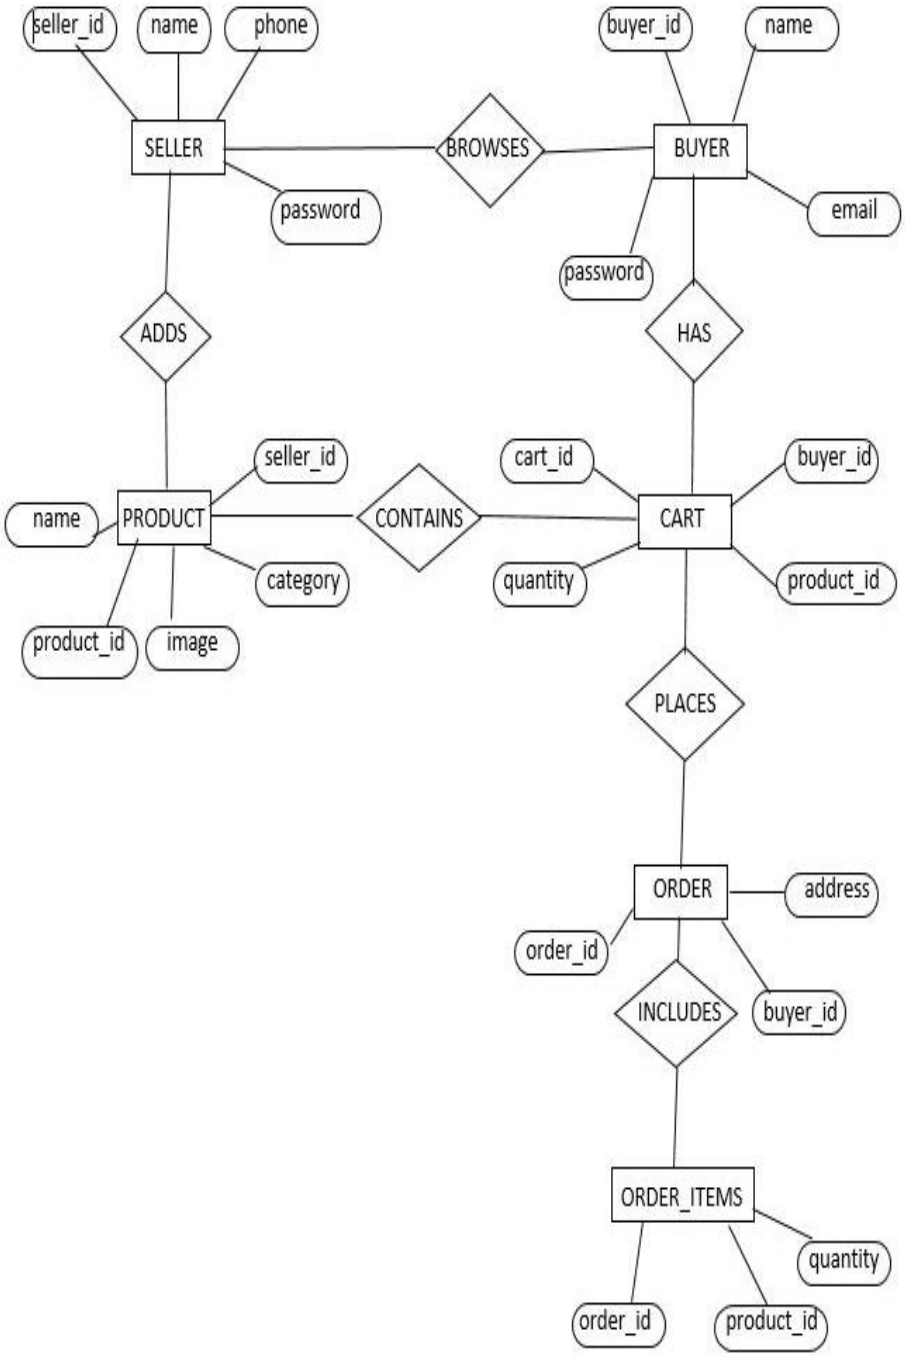
9.View Cart

The buyer can view all selected products in the cart, check quantities, and review total cost before proceeding further.

10.End

The process ends after reviewing the cart or placing the order successfully.
The buyer may continue shopping or exit the system**.**

5.4 Entity-Relationship Diagram:- -



Database Entities Description:-

This ER diagram represents the structure of the SwadSakhi e-commerce system. It includes five main entities: Seller, Products, Buyers, Cart, and Orders.

1. The **Seller entity** stores details like seller_id, name, phone, and password. A seller can add multiple products, establishing a one-tomany relationship with the Products entity.
2. The **Products entity** contains product-related information such as product_id, name, price, category, and image. Each product is linked to a seller.
3. The **Buyers entity** holds customer details like buyer_id, name, email, and password. Buyers interact with the system to purchase products.
4. The **Cart entity** represents the items selected by buyers. It includes attributes like cart_id, buyer_id, product_id, and quantity. A buyer can have multiple cart items, forming a one-to-many relationship.
5. The **Orders entity** stores order details such asorder_id, buyer_name, email, and address. Buyers place orders based on the items in their cart.
6. Relationships like ADDS, CONTAINS, ADDED BY, and PLACES define how these entities interact. These relationships ensure proper data flow between sellers, products, buyers, carts, and orders.

Chapter 6
Result and Application

6.1Result:-

Fig 6.1 Registration page

The homepage provides a user-friendly interface showcasing products added by sellers. It includes a search bar for easy product discovery, a cart for managing selected items, and dedicated buttons for Seller Login and Admin Login. The design ensures smooth navigation and efficient browsing for users.

```
# -------- HOME --------
<!-- SLIDER -->
<div class="slider"> <img class="slide" src="{{ url_for('static', filename='images/banner1.jpg')
}}">
   <img class="slide" src="{{ url_for('static', filename='images/banner2.jpg')
}}">
   <img class="slide" src="{{ url_for('static', filename='images/banner3.jpg')
}}">
</div>

<script> let slides = document.querySelectorAll(".sl ide"); let index = 0;
function showSlides() {
slides.forEach(s => s.style.opacity = "0");
 slides[index].style.opacity = "1";
   index++;   if(index >= slides.length){   index = 0;
   }
}
```

Fig.Search Bar

The search bar allows users to easily search and find products by entering keywords, making browsing faster and more convenient.”User Only found products Which are already enter by the seller.If the buyer search the product which is not in website then by default system give message “Product Not Found!!”

```
#-----Search Bar-------#
<header>
<h1>SwadSakhi □</h1>
<nav>
<form method="get" action="/buyer_dashboard" class="search-box">
   <input type="text" name="search" placeholder="Search food...">
<a href="/buyer_login">Login</a>
<a href="/seller_login">Seller</a>
<a href="/admin_login">Admin</a>
</form>
</nav>
</header>
```

)

Fig 6.1 Search Product Result

The Search Product Result is as follows When the buyer search the product then result will display as above give

1.Product Image.
2.Product Name.
3.Product Category.
4.Ingredients.
Above information is Visible to buyer after search.

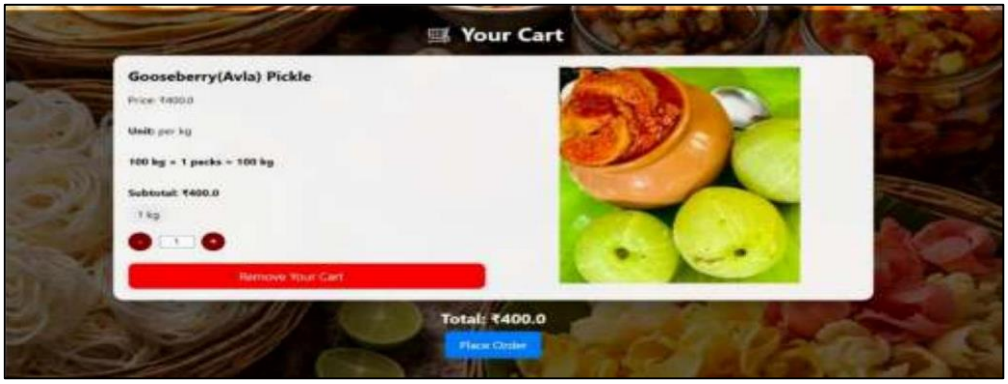


Fig 6.1 Cart Adding and Placing Order

This screen represents the shopping cart page of the application. It displays the product selected by the user along with its details. The product shown here is Gooseberry (Amla) Pickle, including its price per kilogram and quantity selection options.

Users can increase or decrease the quantity using the plus and minus buttons, and the subtotal is updated accordingly. The interface also provides a “Remove Your Cart” button to delete the item from the cart.

On the right side, the product image is displayed for better visualization. At the bottom, the total amount is shown along with a “Place Order” button, allowing the user to proceed with the purchase.

```
# 🛒 CART #
<body>
<div class="overlay ">
 <h1>□ Your Cart</h1>
 {% for item in items %} <div class="cartcard">

Fig. Order Confirm Page

Login Page of Buyer

The first section shows a Login Interface where users are required to enter their:

Email ID
Password
Below the input fields, there are buttons for:
Login
Register

The background contains food-related visuals, giving an attractive and userfriendly appearance aligned with the theme of homemade food services.

When the Buyer login into the system after a particular Buyer gets its own Dashboard by using they buy products. If they wants to LOGOUT then we give the logout Button.

Registration Page of Buyer

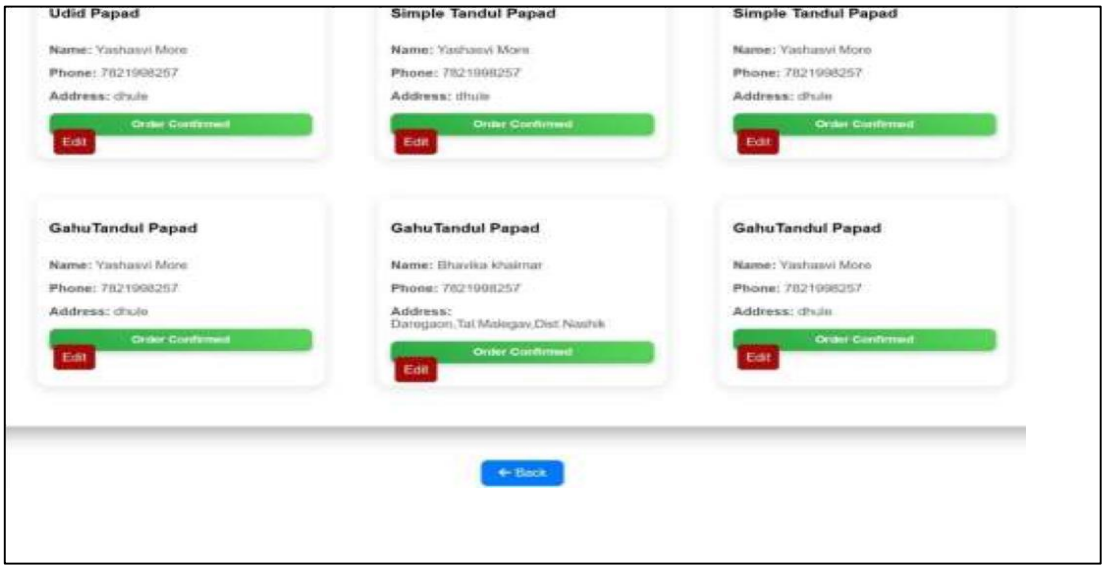
The second section presents a Registration Form where new users can create an account by entering required details. A Register button is provided to submit the information.

Order Confirmation Page

The last section shows an Order Confirmation Screen for a product (Mango Pickle). It includes:

Customer Name
Phone Number
Address
A green button labeled “Order Confirmed” indicates successful placement of the order.

Below it, a “Back to Home” button allows navigation to the homepage.



The above diagram of Order Confirmation and If Buyer wants to edit address then We give option to edit her/his profile. And then cofirme order.OR not wants to edit then also buy directly products.

```

      <a href="/edit_order/{{order[0]}}">Edit</a> </div>
 {% endfor %}
{% else %}
   <h3>No Orders Found</h3>
{% endif %}
</div>
<a href="/buyer_dashboard" class="back-btn">
   <i class="fas fa-arrow-left"></i> Back
</a>
```

Fig. Seller Login

Fig.Seller Add Products Pages.

Seller Login Page

The upper section represents the Seller Login interface. It allows registered sellers to access the system by entering:

1. 10-digit mobile number
2. Password
3. Below the input fields, there are buttons for:
4. Login
5. Registration (for new sellers)

The background includes food-related visuals, maintaining consistency with the application's theme.

Seller Registration Page

The lower section displays the Seller Registration form, where new sellers can create an account by providing:

a. Name
b. Mobile number (10-digit)
c. Address
d. Password

A Submit button is provided to complete the registration process.

Seller Add Products Page Description

The Seller Add Products Page is designed to help sellers manage and display their products easily. On this page, multiple product cards are shown in a structured layout. Each card includes the product image, product name, price, category, and a short description, making it easy for sellers to review their listed items.

At the bottom of each product card, there is an action button that allows sellers to manage or update product details if needed. The page layout is visually appealing with a food-themed background, enhancing the overall user experience.

Additionally, the page includes the following main navigation buttons:

Add Product Button: Allows the seller to add a new product by entering details like name, price, image, and description.

Home Page Button: Redirects the seller back to the main dashboard or homepage.

Orders Button: Enables the seller to view and manage customer orders.

This page helps sellers efficiently organize their products and perform key actions from a single interface.

```

conn.commit()      conn.close()
return redirect("/seller_dashboard")
```

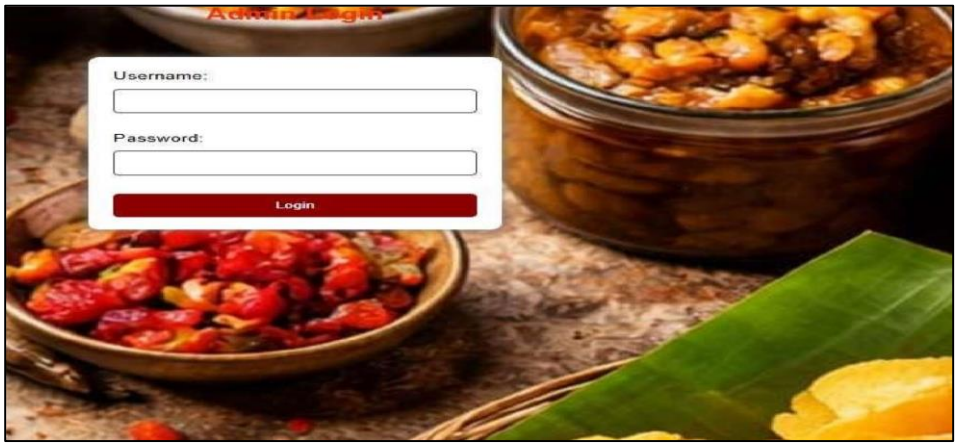

Fig. Admin Login

Fig.Admin Dashboard

Admin Login Page Description

The Admin Login Page is designed to provide secure access to the admin panel of the system. It contains input fields for Username and Password, where the admin enters valid credentials to log in. A Login button is provided to submit the details.

The page has a visually appealing food-themed background that matches the theme of the project. This page ensures that only authorized users (admins) can access and manage the system functionalities**.**

Admin Dashboard Description

The Admin Dashboard is the main control panel for the admin after successful login. It displays different sections and options that help the admin manage the system effectively.On this page, the admin can view important
information such as List of sellers,List of buyers,Product details
System overview

The dashboard provides easy navigation to different modules, allowing the admin to monitor and control all activities of the system from one place. The layout is simple and user-friendly with a background that maintains the food-based theme of the application.

```
# -------- ADMIN LOGIN --------
 @app.route("/admin_login", methods=["GET", "POST"]) def admin_login():
 if request.method == "POST":
username = request.form["username"]
  password = request.form["password"]
# Fixed Admin Login
if username == "admin" and password == "admin123":
session["admin_id"] = username
return redirect("/admin_dashboard")
    return "Invalid Username or Password"
return render_template("admin_login.html")

# -------- ADMIN DASHBOARD --------
 @app.route('/admin_d
ashboard')
def admin_dashboard():
 conn    = sqlite3.connect("database.db")     cursor = conn.cursor()
   # Seller Count
cursor.execute("SELECT COUNT(*) FROM sellers")
_count = cursor.fetchone()[0]
  # Buyer Count
cursor.execute("SELECT COUNT(*) FROM buyers")
```

```
buyer_count = cursor.fetchone()[0]
 # Product Count
cursor.execute("SELECT COUNT(*) FROM products")
product_count = cursor.fetchone()[0]      conn.close()
 return        render_template(        "admin_dashboard.html",seller_count=seller_count,
buyer_count=buyer_count,
product_count=product_count
```

Chapter 7

Testing

7.1 Introduction

This chapter covers the testing activities performed for the Web Application for Swad Sakhi Food Platform. Testing of this system is critical because it serves as a platform for connecting customers with women entrepreneurs who provide homemade food services. The system manages food browsing, ordering, delivery coordination, and payment processes for users including customers and food sellers. If any module fails or behaves incorrectly, the system may not function reliably.

The objective of this testing phase is to verify that all functionalities work correctly across all user roles. The system should allow valid users to register and log in successfully, browse food items, place and manage orders, track deliveries, and handle payments. It must also reject unauthorized access and invalid inputs, and ensure proper validation of all required fields. Testing was structured to cover both positive scenarios (successful login, food ordering, delivery updates, and payment processing) and negative scenarios (wrong credentials, empty fields, invalid inputs, and unauthorized access).

Testing was performed using two tools:

Selenium IDE: Record-and-playback based UI test automation tool used for quick scenario capture and regression testing of the Swad Sakhi platform, such as user registration, login, and food ordering processes**.** **Selenium WebDriver**: Scripted browser automation tool used for executing test cases programmatically, ensuring reliable and repeatable testing of functionalities like order placement, payment processing, and user interactions with evidence-based results.

Out of scope for this chapter:

1. Registration module testing.
2. Food order booking and payment module testing.
3. Delivery tracking and order return module testing.
4. API load testing and performance benchmarking.

7.2 Test Plan

The test plan defines the objectives, scope, testing environment, tools, entry and exit criteria, and risk factors associated with the login module testing cycle of the Web Application for Swad Sakhi Food Platform. This test plan has been prepared following the IEEE standard format to ensure a well-structured and standardized documentation approach.

A structured test plan ensures that testing activities are disciplined, consistent, and reproducible, and are aligned with the overall quality goals of the project. It also facilitates better understanding, communication, and effective management of the testing process.

Test Plan:"SwadSakhi Web Based Homemade Food Platform"

Version: 1.0

Test Plan ID: TP_REG_01

1. **Introduction**

This test plan verifies that the registration module of the Swad Sakhi Food Platform works correctly. It ensures that new users (Customers and Women Food Sellers) can register successfully using valid inputs, and invalid inputs are handled properly with appropriate error messages.

It also validates data storage, input validation, and system reliability, ensuring a smooth, secure, and user-friendly registration process for all users of the platform.

2. **Test Items**

1. Registration form UI elements – input fields, submit button, error messages.
2. Name, Email, Mobile Number, and Password validation.
3. Role selection (Buyer / Seller).
4. Form submission and database storage.
5. Error message display for invalid or empty inputs.

3. **Features to be Tested**

1. Invalid registration with wrong inputs (email, mobile number, password)
2. Empty field validation.

3. Duplicate email/mobile number validation.
4. Password strength validation.
5. Role-based registration (Buyer / Women Food Seller).
6. Successful data storage in database

4. Features Not to be Tested Payment system

1. Food order management 2. Billing and invoice generatio.
3. Admin dashboard.
4. Reports and analytics

5. Approach

1. Functional and non-functional testing will be performed.
2. Positive and negative test cases will be executed.
3. Manual testing and Selenium automation will be used.
4. UI validation testing will be included.
5. Backend API testing using Postman.

6. Pass / Fail Criteria

1. All high-priority test cases must pass successfully.
2. Minimum 95%–99% requirement coverage should be achieved.
3. System should not have any critical or blocking defects.
4. Expected results should match actual results.
5. All major defects must be fixed and retested before completion.

7. Suspension Criteria and Resumption Requirements

1. Testing will be stopped if critical bugs occur.
2. Testing will resume after bug fixing and system stabilization.

8. Test Deliverables

1. Test plan document.
2. Test cases document.
3. Defect report.
4. Test summary report.

9. Test Tasks

1. Prepare test plan and test cases .
2. Execute test cases .
3. Identify and log defects .
4. Retest fixed defects .
5. Prepare final report (test report)

10. Test Environment

1. Operating System: Windows 11 .
2. Browser: Google Chrome, Microsoft Edge.
3. Frontend: HTML, CSS, JavaScript.
4. Backend: Python (Flask / Django).
5. Database: SQLite / MySQL.
6. Server: Localhost / Test Server.
7. Tools: Selenium IDE, Postman..
8. Network: Internet connection .

11. Responsibilities

1. QA Lead: Review test documents and ensure quality standards.
2. Test Engineer: Execute test cases and log defects.
3. Developer: Fix defects and update the system.
4. Project Manager: Approve final release.

12. Staffing and Training

Requires knowledge of registration module functionality, testing techniques, and Selenium tools.

13. Scheduling

Project deadline: 20 March 2026, 12:00 PM

14. Risks

1. Insufficient test data.
2. Insufficient testing resources .

3. Changing product requirements.
4. Browser compatibility issues .

Test Case Register Module

Test Case ID	**Objective**	**Input (Steps)**	**Expected Result**	**Actual Result**	**Status**
TC_REG_001	Registration w data	Name: abc Email:abc@ga m il.c Mobile: 1 Password: abc@123 Role:Customer	User should register successfull saved in database	User successfull y	Pass
TC_REG_002	Registration with field	All fields blank	System should dis "Please fill all field	Message correctyle.	Pass
TC_REG_003	Registration with	Email:abc123	Show "invalid	Error displayed .	Pass
TC_REG_004	Registration with	Password:	System Should Display "password is requir	Message displayed	Pass
TC_REG_005	Registration with ssword	Password: 12345	System Should dis "Weak password"	Message correctly	Pass

TC_REG_ 006	Registration with	Email already registered	System should displ already exists”	Error displayed	Pass
TC_RE G_007	Registration with	Mobile:1234	System should displayed”Inv ali number”	Error Message disp	Pass
TC_RE G_008	Role selection va	No role selected	System should “Please select role”	Message displayed	Pass
TC_RE G_009	Registration as Buyer	Valid details+Role: Customer	User register Successfully	Registered	Pass
TC_RE G_010	Multiple registration restriction	Enter invalid/duplicat e data multiple times and click repeatedly.	System should rest multiple registrati on attempts displa y warning message	System unlimited registration without restriction	Fail

7.3 Defect Report:-

The defect report is a crucial document used to record and track defects identified during the testing process of the Swad Sakhi Home made Food Platform. It provides detailed information about each defect, including its description, severity, priority, steps to reproduce, and current status.

This report helps the development and testing teams to understand, prioritize, and resolve issues efficiently. It also ensures effective communication among team members and maintains transparency throughout the defect management process.

Defect Report 1:-

Defect Report 1 (Login Module)

Defect ID:	DR_REG_0010
Project Name:	Swadsakhi Homemade Food Platform
Product:	Web Application
Release Version:	v1.0
Module:	User Registration Module
Detected Build Version:	v1.1
Summary:	System allow unlimited registration attemps without restriction
Description:	While executing the registration module test scenarios of the Homemade Food Platform, it was observed that the system does not restrict multiple registration attempts. When a user enters invalid or duplicate data multiple times and repeatedly clicks on the register button, allows unlimited registration attempts without displaying any warning message or applying any blocking mechanism. This behavior may lead to security risks and potential misuse of the system, such as spam registrations or unauthorized access attempts.
Actual Result:	System allows unlimited registration attempts without any restriction.
Expected Result:	System should restrict multiple registration attempts or display warning message for security
Severity:	High (System allows unlimited registration attempts, which may lead risks and misuse of the system)
Priority:	High (Issue affects system security and needs immediate fix to preve

7.4 Test Plan

Test Plan: (SwadSakhi Webbased Homemade food platform) Version: 1.0

Test Plan ID: TP_LOGIN_01

1. **Introduction**

This test plan verifies that the Customer Login Module of the Swad Sakhi Food Platform works correctly. It ensures that valid users (customers and food sellers) can log in successfully and invalid inputs are handled properly with appropriate error messages. It also checks authentication, session management, and system security to provide a smooth and secure login experience.

2. **Test Items**

2. Login form UI elements – email, password fields, buttons
3. Email and password validation
4. Login button functionality
5. Error message display
6. Session creation after login
7. Navigation after successful login

3. **Features to be Tested**

1. Login with valid credentials
2. Login with invalid credentials
3. Empty field validation
4. Invalid email format validation
5. Password validation
6. Error message handling
7. Session management
8. Navigation to dashboard after login

4. Features Not to be Tested

1. Registration module
2. Order management
3. Admin dashboard 4.Reports and analytics

5. Approach

1. Functional and non-functional testing will be performed
2. Positive and negative test cases will be executed
3. Manual testing and Selenium automation will be used
4. UI validation testing will be included
5. API testing using Postman

6. Pass / Fail Criteria

1. All high-priority test cases must pass
2. Minimum 95% coverage should be achieved
3. No critical defects should remain
4. Expected and actual results should match

7. Suspension Criteria and Resumption Requirements 1. Testing will be stopped if critical bugs occur

2. Testing will resume after bug fixing .

8. Test Deliverables

1. Test plan document
2. Test cases document 3. Defect report

4. Test summary report

9. Test Tasks

1. Prepare test plan and test cases
2. Execute test cases
3. Identify and log defects
4. Retest fixed defects

5. Prepare final report (test report)

10. Test Environment

1. Operating System: Windows 11
2. Browser: Google Chrome, Microsoft Edge
3. Frontend: HTML, CSS, JavaScript
4. Backend: Python (Flask / Django)
5. Database: SQLite / MySQL
6. Server: Localhost / Test Server
7. Tools: Selenium IDE, Postman

7.4 Test Plan

Test Plan: (Web Application for Water Jar Distribution System) Version: 1.0

Test Plan ID: TP_LOGIN_01

1. Introduction

This test plan verifies that the Customer Login Module of the Swad Sakhi Food Platform works correctly. It ensures that valid users (customers and food sellers) can log in successfully and invalid inputs are handled properly with appropriate error messages. It also checks authentication, session management, and system security to provide a smooth and secure login experience.

2. Test Items

- Login form UI elements – email, password fields, buttons
- Email and password validation
- Login button functionality
- Error message display
- Session creation after login

3. Features to be Tested

- Login with valid credentials
- Login with invalid credentials
- Empty field validation
- Invalid email format validation
- Password validation
- Error message handling
- Session management
- Navigation to dashboard after login

4. Features Not to be Tested

- Registration module
- Order management
- Admin dashboard
- Reports and analytics

5. Approach

- Functional and non-functional testing will be performed
- Positive and negative test cases will be executed
- Manual testing and Selenium automation will be used
- UI validation testing will be included
- API testing using Postman

6. Pass / Fail Criteria

- All high-priority test cases must pass
- Minimum 95% coverage should be achieved
- No critical defects should remain
- Expected and actual results should match

7. Suspension Criteria and Resumption Requirements

- Testing will be stopped if critical bugs occur
- Testing will resume after bug fixing .

7.5Test Plan

The test plan defines the objectives, scope, testing environment, tools, entry and exit criteria, and risk factors associated with the login module testing cycle of the Web Application for Swad Sakhi Food Platform. This test plan has been prepared following the **IEEE standard format** to ensure a well-structured and standardized documentation approach.

A structured test plan ensures that testing activities are disciplined, consistent, and reproducible, and are aligned with the overall quality goals of the project. It also facilitates better understanding, communication, and effective management of the testing process.

Test Plan: (Swad sakhi Home made food Platform) Version: 1.0

Test Plan ID: TP_Order_01

1.Introduction

This test plan verifies that the Food Order module of the SwadSakhi Food Platform works correctly. It ensures that customers can place food orders successfully using valid inputs such as food item selection, quantity, delivery address, and contact details. It also checks input validation, total price calculation, and smooth order submission process.

2.Test Items

- Order form UI elements (dropdown, input fields, buttons)
- Order type selection (Regular/Event)
- Product quantity input
- Price calculation and total amount
- Place Order button

3. Features to be Tested

- Empty field validation
- Invalid input handling
- Address validation
- Price calculation

4. Features Not to be Tested

- Login and registration modules
- Admin dashboard
- Reports and analytics

5. Approach

- Functional and non-functional testing will be performed
- Positive and negative test cases will be executed
- Manual testing and Selenium automation will be used
- UI validation testing will be included
- Backend API testing using Postman

6. Pass / Fail Criteria

- All high-priority test cases must pass
- Minimum 95% coverage achieved
- No critical defects
- Expected results match actual results

7. Suspension Criteria and Resumption Requirements

- Testing will be stopped if critical bugs occur
- Testing will resume after bug fixing issues

8. Test Deliverables

- Test plan document
- Test cases document
- Defect report
- Test summary report

9. Test Tasks

- Prepare test plan and test cases
- Execute test cases
- Identify and log defects
- Retest fixed defects
- Prepare final report (test report)

10. Test Environment

- Operating System: Windows 11
- Browser: Google Chrome, Microsoft Edge
- Frontend: HTML, CSS, JavaScript
- Backend: Python (Flask / Django)
- Database: SQLite / MySQL
- Server: Localhost / Test Server
- Tools: Selenium IDE, Postman
- Network: Internet connection

11. Responsibilities

- QA Lead: Review artifacts
- Test Engineer: Execute tests and log defects
- Developer: Fix defects
- Project Manager: Approve release

12.Staffing and Training

Requires knowledge of Order module functionality, testing techniques, and tools.

13.Scheduling

Project deadline: 20 March 2026, 12:00 PM

14. Risks

- Incorrect price calculation
- Invalid input handling
- Date selection errors
- Server/database issues
- UI/UX problems

7.5 Test Case Order Form

Test Case ID	Objective	Input (Steps)	Expected Result	Actual Result	Status
TC_ORD_002	Empty fields Validation	Leave all fields blank and click Place Order	System should display "Please fill all fields"	Message displayed.	Pass
TC_ORD_003	Invalid pincode	Enter piccode:123	Show should show"invalid pincode"	Error message displayed .	Pass
TC_ORD_004	Invalid date selection	End date before start date	System Should show"error message"	Error displayed	Pass
TC_ORD_005	Address empty	Leave address blank	System should show "Address required"	Message displayed	Pass
TC_ORD_006	Jar quantity validation	Enter jars:0	System should not allow order	Error displayed	Pass
TC_ORD_007	Price calculation	Jars:2(Rs 20 each)	Total should be Rs 40	Correct total show	Pass
TC_ORD_008	Advance calculation	Total Rs40	Advance Should be Rs 8(20%)	Correct advance shown	Pass
TC_ORD_009	Order selection	Select Event Order	System should accept selection	Order selected	Pass
TC_ORD_010	Multiple order attempts	Click Place Order multiple times	System should redtrict multiple requests	System allows multiple Orders without restriction	Fail

7.7 Defect Report:-

The defect report is a crucial document used to record and track defects identified during the testing process of the Swad Sakhi Food Platform. It provides detailed information about each defect, including its description, severity, priority, steps to reproduce, and current status.

This report helps the development and testing teams to understand, prioritize, and resolve issues efficiently. It also ensures effective communication among team members and maintains transparency throughout the defect management process.

Defect Report :-

Defect ID:	DR_ORD_001
Project Name:	Web Application for Water Jar Distribution System
Product:	Web Application
Release Version:	v1.0
Module:	New Delivery Request Module
Detected Build Version:	v1.1
Test Case ID	TC_ORD_010
Summary:	Multiple order submissions are not restricted
Description:	During testing of the New Delivery Request module, it was observed that the system allows users to place multiple orders by clicking the "Place Order" button repeatedly. There is no restriction, validation, or disabling of the button after submission. This results in duplicate orders being created in the system, which may lead to incorrect order processing and misuse.
Actual Result:	System allows multiple order submissions without any restriction
Expected Result:	System should allow only one order submission and disable the button or show a warning message
Severity:	High (Duplicate order and system misuse issue)
Priority:	High (Needs immediate fix)
Reported By:	Test Engineer
Status:	Open

Chapter 8
Conclusion and Future Scope

Conclusion:

The **SwadSakhi** project was successfully developed as a userfriendly and efficient web-based platform aimed at connecting food lovers with homemade food providers. Throughout the development process, the system evolved from a basic idea into a fully functional application that supports user interaction, order placement, and smooth management of food services.

The project effectively addressed the limitations of traditional food ordering systems by focusing on homemade, hygienic, and locally prepared food. Features such as user registration, login authentication, menu display, order placement, and order confirmation were implemented to enhance user experience. The system ensures simplicity, accessibility, and convenience for both customers and food providers.

During the development phases—from requirement analysis, system design, implementation, to testing—special attention was given to usability and performance. The use of appropriate technologies helped in creating a responsive and reliable platform.

In conclusion, SwadSakhi fulfills its objective of promoting homemade food services while providing a digital solution for easy food ordering. The project demonstrates practical application of web development concepts and has the potential for future enhancements such as online payment integration, AI-based recommendations, and mobile app support.

Future Scope:

Mobile Application Development:- In the future, a mobile application can be developed to allow users to access the Songir Handcraft Utensils Portal easily through smartphones and tablets.

Online Payment Integration Secure:- payment gateways such as UPI, debit card, credit card, and net banking can be integrated to provide safe and convenient online transactions.

Real-Time Order Tracking:- A real-time tracking system can be implemented so customers can monitor the status of their orders from dispatch to deliver

Multi-Language Support:-The portal can be expanded to support multiple languages such as Marathi, Hindi, and English to make it more user-friendly for local and national users.

Advanced Search and Filtering:- Smart search options and filters can be implemented to help users quickly find specific handcrafted utensils based on category, price, or popularity
